

Credit Name: CSE 2110

Assignment Name: Exercise 16 bridge

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

i started the challenge by figuring out how i wanted to do the bridge step randomizer, the hardest part was probably just making sure there were enough restrictions so that the program didnt walk negatively, but that was solved by adding in extra if statements

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

i mainly focused on the internal bridge step randomizer, making sure to test it along the way, and then built most of the program around it to ensure that the core of it was working properly before anything else

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I mainly started by just develing the internal randomizer of it first, chipping away at it slowly before starting on the input and output which were naturally seperate peices of the program because the were on opposite ends of the program.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

the most difficult part was just ensuring that the programs random steps wouldn't exceed the boundaries of what it should(going far into the negatives or not recognizing that it should stop)

Learning

Was there anything you learned that you think will help you with future challenges?

after funning the program with larger parameters and scales, i was able to some patterns emerge, most interestingly the fact the the average is almost always the square of the bridge length. This information won't really help me in future projects, but it was neat to experiment with
