

Credit Name: CSE 2110

Assignment Name: exercise 14 dice rolling game

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

i experimented with the formatting of text, i wanted the columns to line up properly, regardless of the values in between. i ended up going to a bunch of different websites searching for the solution, once i finally found what i wanted and figured out how to properly use it i put it in place but ended up removing it because it felt unnecessary.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

i started by creating the title and some variables that i might use, mainly focusing on what the user would see when running the program. once i finished with those i moved onto the rolling aspect of the program along with getting the total for both dice. once i finished with all of the internal stuff i worked on outputting the right values to the user

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I divided it into what the user would see when they open the program (the title and initial variables/inputs), the internal calculations and random rolls for the dice, and the output for the user at the end

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

the hardest part was figuring out the formatting for the table that would display the rolls, it took a while of searching the internet for ways to put the text into specific positions.

Learning

Was there anything you learned that you think will help you with future challenges?

i learned how to ensure that an output would put something at a certain distance from the beginning of the line. This will be useful during future projects where the output might be organized into a table/chart.
