

Credit Name: CSE 2110

Assignment Name: Chapter 6

Question 2

Method declaration gives its usage via name, return type (string, integer, boolean), and parameters while method body is the code

Question 3

The access modifier

Question 4

Visibility

Question 5

var1)

In the “main” method

var2)

In the “main” method in a loop

var3)

In the method “method1”

var4)

In the method “method2” in a loop

Question 6

- a) private static int getVowels(String[] args)
- b) private static int extractDigit(int[] ints)
- c) private static int insertString(String[] args , int[] ints)

Question 7

- a) Types of values it gets
- b) No, if 2 methods had the same name and one was called upon, there would be an error or only one of the 2 methods would run

Question 8

- a) Returns a value
- b) Returns a maximum of one value
- c) private static String getValue(String[] args)
private static void solveDigits(String[] args)
Void = no value returned
String = String value returned

Question 9

Method “main” is not in a class unlike method “doSomething” which is in class the “MethodCallExample”, the fact that a method is inside another class is an issue

Question 11

- a) True (in vocab list on the page before)
- b) False (you don't need to declare the method again to call upon it)
- c) False (void means no value returned)
- d) False (access modifiers only change how it can be accessed)
- e) True (on page before)
- f) True (things like loops, methods and classes have curly brackets)
- g) False (limited to only the method it was declared in)
- h) True (can be changed if passed to a method)
- i) False (2+ methods with the same name in a class, 1o different methods are okay)
- j) True (thats why its called a "return" statement)
- k) True (states initial requirements)
- l) False (postcondition is what has to be true after code is executed)
