

Credit Name: CSE 2110
Assignment Name: exercise 9

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I started by mapping out the general structure of my program and deciding what in specific i would need to run the program.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

i broke the code down into three main parts, the drawing of stones, user input/display output, and the act of drwaing the stones

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

ii started by getting a rough outline for what the user would see and input, then i worked drawing stones for both the user and the computer, next i added the ability to check whether the game should be running and if/who won, finally i tied it all together and finsished up the last of the user side

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

the most difficult part was learning how use seperate objects, i tried learning it on my own and once i finally got a grasp of it for myself the next class lesson expained it which cleared up some of my confusion.

Learning

Was there anything you learned that you think will help you with future challenges?

i learned about object oriented programming, this will be **crucial** to future challanges and enevoures.
