

Credit Name:CSE 2110

Assignment Name: exercise 8 hi lo game

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I thought about the what things i would need for the program and what the general structure of it would be. Most of it was pretty straight forwards but i revised the order of somethings to make it more effecient

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

i broke the code into the initial output, risking pints, and guessing high or low, and then planned to do the the win conditions, a running loop, and final outputs seperately

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I wrote the code in several smaller parts, the initialization of variables along with the initial output for the user, choosing how many points you would like to risk along with calling whether it would be high or low, then win condition (whether the user guessed right) and the output for them. Finally i added a loop to ensure that the user would like to keep playing.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

The most difficult part of this program was likely just getting the structure right, making sure that things were in the right place and that everything was working well together

Learning

Was there anything you learned that you think will help you with future challenges?

I didnt really learn anythin new during the development of this program that would aid me in future problems
